Same number. New scale.

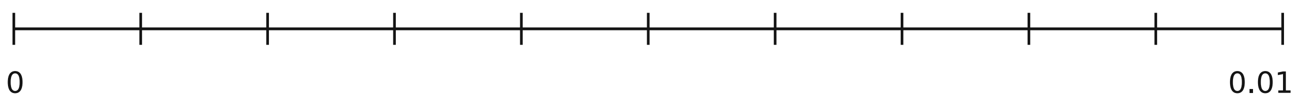
Name: ______________________________ Date: ______________

Keep the number 0.008. Predict its position on each line.

Each line has 10 equal spaces. Label one jump before placing the point.

1 From 0 to 0.01

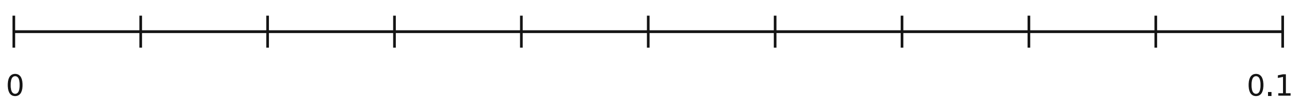
One jump = ______________



Mark 0.008 exactly. How many jumps from 0? ______________

2 From 0 to 0.1

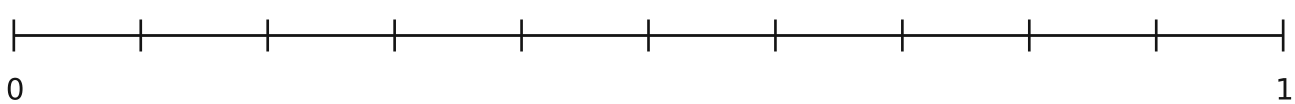
One jump = ______________



About where is 0.008? It lies between the marks ________ and ________.

3 From 0 to 1

One jump = ______________



About where is 0.008? It lies between the marks ________ and ________.

Explain what changed

The number stayed 0.008. Why did its position change?

Use an endpoint or the value of one jump in your explanation.

____

____

____

Partner check: Are the spaces equal? Can you read each scale?

Read big numbers by place.

Name: ____________________ Date: ____________

SEE AN EXAMPLE

Which is greater: 2,306,000,000 or 2,360,000,000?

Read each group of three digits with its period name.

Billions	Millions	Thousands	Ones
2	**306**	000	000
2	**360**	000	000

Both have 2 billions and 3 hundred-millions.

Compare the next place: 0 ten-millions is less than 6 ten-millions.

So 2,360,000,000 > 2,306,000,000.

TRY TOGETHER

Compare 3,405,000,000 and 3,450,000,000.

Write each number in the chart. Read it aloud to your partner.

Billions	Millions	Thousands	Ones

Which is greater? Name the first place with different digits.

TRY ON YOUR OWN

Compare 807,090,000 and 870,009,000.

Which is greater? Explain using the first place that decides.

Check your reasoning: Compare from the greatest place first.
