

From a promise to a result

Start here: Start with the Cedar LNG source pair, then the fictional river challenge. For a replacement or follow-up stage comparison, use three existing Earth cards: Canada microbeads, loss-and-damage funding, and China's historical poverty reduction.

Evidence ladder

Proposal → agreement → implementation → measured result. A card may show several stages; leave any unsupported stage blank.

Source comparison

Use Cedar LNG A and B below as a bounded same-event comparison. These are a joint project announcement and public decision bulletin, not independent journalism. Compare their purposes and missing evidence.

Fictional river challenge

Plastic pellets cross two regions into a shared bay. Choose three actions: prevent spills, monitor with communities, share findings, clean up, or review later. No group can do everything.

Stress cards

Rain spreads the pellets. Funding ends. A different upstream source is found. A community rejects a harmful cleanup method. Choose one and revise.

Two practice plans

Plan A: spend everything cleaning the bay once. Plan B: split effort between spill prevention, community-led monitoring and a six-month review. Neither has measured results yet. Which missing evidence would change your choice?

Cedar LNG · a B.C. decision in March 2023

Read A and B. Mark a shared fact, a different emphasis, and a result neither source proves.

A · Haisla-majority-owned project partnership · 14 March 2023

The Haisla Nation and Pembina announced provincial approval for a proposed floating natural-gas export facility on Haisla-owned land in Kitimat. Haisla leadership connected the project to economic self-determination. The partners described expected jobs and environmental benefits. These are their aims and claims, not measured outcomes.

[Read the joint announcement and attributed Haisla statement](#)

B · B.C. public decision · 14 March 2023

The Province reported issuing an environmental assessment certificate with 16 enforceable conditions. Requirements included emissions planning, community complaints, marine-use communication with First Nations, and hiring and housing plans. Approval with conditions does not prove there will be no harm.

[Read the provincial decision](#)

Your case card: Who owns and decides? What benefit is claimed? Which condition addresses a possible cost? What later evidence would show whether it worked?

Keep the limit: This is a historical decision snapshot, not the project's current status. Haisla is a specific Nation and government, not a voice for all Indigenous Peoples. The joint project source has a financial interest; the approval source is not independent proof of results. Do not role-play a Nation or infer unanimous consent.

[Open the existing Earth source cards and their print view](#) · Select just the named cards. Their source dates and limitations travel with them.

Our thinking · name / team: _____

For each real card: action, source/date, stage supported, result still unknown, next check.

For your fictional agreement: lead, resources, rights/decision role, three actions, one uncovered need, review date and one measurable signal.
