

Four real data tiles · Canada

Start here: Draw a 0–100% axis. Build two bars for one year; then add the other year.

2020 · age 15+

92% used the Internet.

2020 · age 75+

62% used the Internet.

2022 · age 15+

95% used the Internet.

2022 · age 75+

72% used the Internet.

Source and meaning

Statistics Canada, Canadian Internet Use Survey; summary published 14 August 2023. Survey population: people 15+ in the ten provinces; excludes institutional residents and people living on reserves. Percent of each named age group, not share of all Internet users.

Gender and opportunity · five-minute discussion

The World Inequality Report 2026 finds that women do more unpaid domestic and care work on average. Sort cooking, paid nursing, childcare and paid building work by whether payment is stated—not by gender. How might time available for paid work affect opportunity? This describes a broad pattern, not every person or household.

Read carefully

Age 75+ is inside age 15+: these are overlapping groups. Do not add or average their rates. Internet use does not measure affordability, connection quality, wealth or a person's ability.

Statistics Canada · dated source · World Inequality Report 2026 · gender and unpaid work. Report edition is not a single data-collection year.

Our thinking · name / team: _____

Label each bar with group, year, % and source. Describe one gap or change in percentage points.

Write one supported claim and one thing the numbers cannot explain. How could a public service include people who do not use the Internet?
