

Notice and wonder

Name: _____ Date: _____

Choose one supplied photo, window view or agreed observation spot. Look closely or use its description. You can write, draw, dictate or use your communication tools.

Example: 'I notice three round droplets along a leaf edge. I wonder how they got there.' The droplets are evidence; their origin is a question.

My image number or observation place: _____

Draw, label or describe a detail you noticed.

Two details I notice

One question I wonder about

What would help me explore my question?

What changed? What stayed?

Name: _____ Place or image pair: _____

Start View A with an observation today. Return to the same place on another day for View B. Or use a same-place dated photo pair your teacher selects. The image bank is not a before-and-after set. Compare viewpoint and weather too.

View A | date: _____ Draw or describe.

View B | date: _____ Draw or describe.

One thing that stayed similar

One change, and the detail that supports it

Could weather, framing or viewpoint affect my comparison?

My next observation or question: _____

Our shared observation map

Names: _____ Date: _____

Choose your agreed route, seated stop, window view or supplied photo. Mark one or two observation points below. A map can be a drawing, a sequence of boxes or a description.

Start with roles: observer chooses a detail; questioner asks about evidence; recorder captures the idea. In a pair, combine two roles. Swap at the next stop or image.

First roles: _____ After the swap: _____

Show the observation point(s), a pause/rest place and the agreed return point. For a photo, mark areas to study.

What would help everyone join this observation?

Think about space, surfaces, rest, noise, image size, a description or a way to respond.

Our shared detail and question

Where might rainwater go?

Name: _____ Date / image: _____

Start with a safe, agreed view of a leaf, puddle, ground surface or supplied photo. Stay within the agreed observation area. Describe what is there before suggesting where water might go.

I observe... Example: water beside a curb.

I think / wonder... Example: it might flow downhill.

Draw a possible water route. Use a solid line for movement you observed and a dotted line for a guess. Or describe the difference in words.

Which detail supports my idea?

What would I need to observe or check next?

Salmon and stream clues

Name: _____ Image number: _____

Use the supplied salmon or stream photo. You do not need to visit a stream or see a live fish. Read or listen to the caption and image description before you begin.

Photo location: _____ Photo date: _____ If the caption does not tell you, write 'not recorded'.

Two details the photo shows

One possible explanation, with a detail that supports it

What can this still image NOT tell me?

Consider what happened before or after, what is outside the frame, or conditions today.

Check the source

Photographer / source: _____ One question I would check in a reliable source:

Does this image show our place today? Yes / No / Not enough information My evidence for that answer:

One idea, one next step

Name: _____ Date: _____

Choose one observation from this journal. Re-read your idea or ask someone to read it with you. Your idea may stay the same, become more precise or change when you consider evidence.

I used to think / I first wondered...

Now I think... because my evidence is...

A small care action I can actually try

Choose your own, or begin with: leave plants where they grow; remind our group to observe from the path; share a careful observation; ask about a barrier to joining in. No purchase is needed.

When / where I can try it: _____ Support I might need:

After I try it: what happened? What might I adjust?
